NAG C Library Function Document

nag_prob_vavilov (g01euc)

1 Purpose

nag_prob_vavilov (g01euc) returns the value of the Vavilov distribution function $\Phi_V(\lambda;\kappa,\beta^2)$.

It is intended to be used after a call to nag_init_vavilov (g01zuc).

2 Specification

```
double nag_prob_vavilov (double x, const double comm_arr[])
```

3 Description

nag_prob_vavilov (g01euc) evaluates an approximation to the Vavilov distribution function $\Phi_V(\lambda;\kappa,\beta^2)$ given by

$$\Phi_V(\lambda;\kappa,\beta^2) = \int_{-\infty}^{\lambda} \phi_V(\lambda;\kappa,\beta^2)d\lambda,$$

where $\phi(\lambda)$ is described in nag_prob_density_vavilov (g01muc). The method used is based on Fourier expansions. Further details can be found in Schorr (1974).

4 References

Schorr B (1974) Programs for the Landau and the Vavilov distributions and the corresponding random numbers *Comp. Phys. Comm.* **7** 215–224

5 Parameters

1: **x** – double *Input*

On entry: the argument λ of the function.

2: **comm_arr**[322] – const double *Input*

On entry: this **must** be the same parameter **comm_arr** as returned by a previous call to nag_init_vavilov (g01zuc).

6 Error Indicators and Warnings

None.

7 Accuracy

At least 5 significant digits are usually correct.

8 Further Comments

nag_prob_vavilov (g01euc) can be called repeatedly with different values of λ provided that the values of κ and β^2 remain unchanged between calls. Otherwise, nag_init_vavilov (g01zuc) must be called again. This is illustrated in Section 9.

9 Example

The example program evaluates $\Phi_V(\lambda;\kappa,\beta^2)$ at $\lambda = 0.1$, $\kappa = 2.5$ and $\beta^2 = 0.7$, and prints the results.

9.1 Program Text

```
