nag_poisson_ci (g07abc)

1 Purpose

nag_poisson_ci (g07abc) computes a confidence interval for the mean parameter of the Poisson distribution.

2 Specification

```
void nag_poisson_ci (Integer n, double xmean, double clevel, double *tl, double *tu,
NagError *fail)
```

3 Description

Given a random sample of size n , denoted by x_1, x_2, \dots, x_n , from a Poisson distribution with probability function

$$p(x) = e^{-\theta} \frac{\theta^x}{x!}, \quad x = 0, 1, 2, \dots$$

the point estimate, $\hat{\theta}$, for θ is the sample mean, \bar{x} .

Given n and \bar{x} this function computes a $100(1 - \alpha)\%$ confidence interval for the parameter θ , denoted by $[\theta_l, \theta_u]$, where α is in the interval $(0, 1)$.

The lower and upper confidence limits are estimated by the solutions to the equations

$$e^{-n\theta_l} \sum_{x=T}^{\infty} \frac{(n\theta_l)^x}{x!} = \frac{\alpha}{2},$$

$$e^{-n\theta_u} \sum_{x=0}^T \frac{(n\theta_u)^x}{x!} = \frac{\alpha}{2},$$

where $T = \sum_{i=1}^n x_i = n\hat{\theta}$.

The relationship between the Poisson distribution and the χ^2 distribution (see page 112 of Hastings and Peacock (1975)) is used to derive the equations

$$\begin{aligned}\theta_l &= \frac{1}{2n} \chi_{2T,\alpha/2}^2, \\ \theta_u &= \frac{1}{2n} \chi_{2T+2,1-\alpha/2}^2,\end{aligned}$$

where $\chi_{\nu,p}^2$ is the deviate associated with the lower tail probability p of the χ^2 distribution with ν degrees of freedom.

In turn the relationship between the χ^2 distribution and the gamma distribution (see page 70 of Hastings and Peacock (1975)) yields the following equivalent equations;

$$\begin{aligned}\theta_l &= \frac{1}{2n} \gamma_{T,2;\alpha/2}, \\ \theta_u &= \frac{1}{2n} \gamma_{T+1,2;1-\alpha/2},\end{aligned}$$

where $\gamma_{\alpha,\beta;\delta}$ is the deviate associated with the lower tail probability, δ , of the gamma distribution with shape parameter α and scale parameter β . These deviates are computed using nag_deviates_gamma_dist (g01ffc).

5 Parameters

1:	n – Integer	<i>Input</i>
	<i>On entry</i> : the sample size, n .	
	<i>Constraint</i> : $\mathbf{n} \geq 1$.	
2:	xmean – double	<i>Input</i>
	<i>On entry</i> : the sample mean, \bar{x} .	
	<i>Constraint</i> : $\mathbf{xmean} \geq 0.0$.	
3:	clevel – double	<i>Input</i>
	<i>On entry</i> : the confidence level, $(1 - \alpha)$, for two-sided interval estimate. For example clevel = 0.95 gives a 95% confidence interval.	
	<i>Constraint</i> : $0.0 < \mathbf{clevel} < 1.0$.	
4:	tl – double *	<i>Output</i>
	<i>On exit</i> : the lower limit, θ_l , of the confidence interval.	
5:	tu – double *	<i>Output</i>
	<i>On exit</i> : the upper limit, θ_u , of the confidence interval.	
6:	fail – NagError *	<i>Input/Output</i>
	The NAG error parameter (see the Essential Introduction).	

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: $\mathbf{n} > 0$.

NE_CONVERGENCE

When using the relationship with the gamma distribution the series to calculate the gamma probabilities has failed to converge.

NE_REAL

On entry, **clevel** ≤ 0.0 or **clevel** ≥ 1.0 : **clevel** = $\langle value \rangle$.

On entry, **xmean** = $\langle value \rangle$.

Constraint: $\mathbf{xmean} \geq 0.0$.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

For most cases the results should have a relative accuracy of $\max(0.5e-12, 50.0 \times \epsilon)$ where ϵ is the **machine precision**. Thus on machines with sufficiently high precision the results should be accurate to 12 significant digits. Some accuracy may be lost when $\alpha/2$ or $1 - \alpha/2$ is very close to 0.0, which will occur if **level** is very close to 1.0. This should not affect the usual confidence intervals used.

8 Further Comments

None.

9 Example

The following example reads in data showing the number of noxious weed seeds and the frequency with which that number occurred in 98 sub-samples of meadow grass. The data is taken from page 224 of Snedecor and Cochran (1967). The sample mean is computed as the point estimate of the Poisson parameter θ . **nag_poisson_ci** (g07abc) is then called to compute both a 95% and a 99% confidence interval for the parameter θ .
